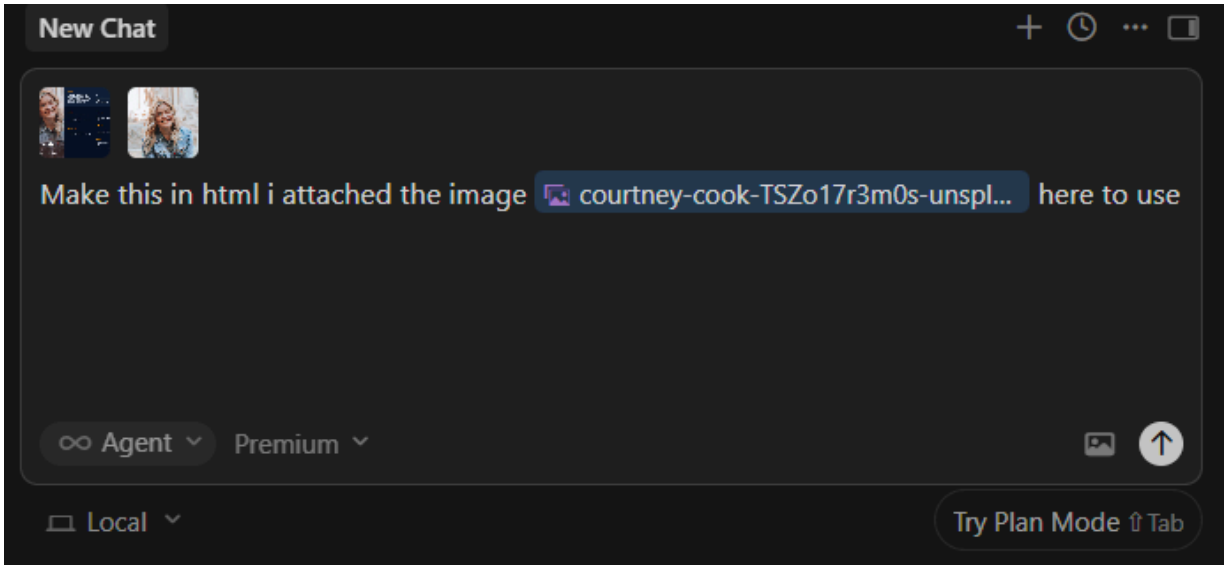
INM420 AI in Webdev - Abdul Waheed Khan Sowdagar

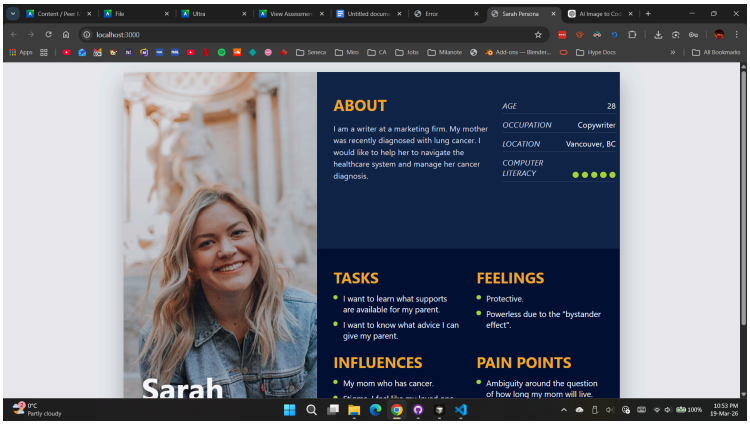
Which/how many AI(s) did you use to convert the image to code?



I used **Cursor** to convert the image into code. I picked it over Claude and ChatGPT since it's a premium tool and offers a lot compared to free options. It can run multiple models like **Claude Sonnet** and **GPT-5.3 (OpenAI)**, plus it has its own agent composer, so I could use different AIs in one place instead of switching between tools.
(i'm using the premium agent option for the code generation)

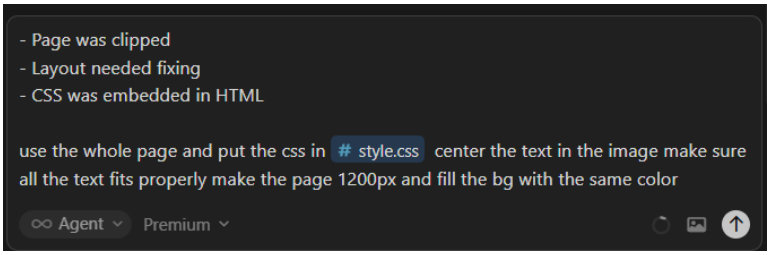
What prompts did you use to tweak the code?

The first generation was a bit off. It got the text and colours right, but it didn't capture the full page—some parts were clipped. The layout needed to be adjusted, and the CSS was all embedded directly in the HTML, which made it harder to manage.



Notes / Issues

- Text and colors were accurate
- Page was clipped
- Layout needed fixing
- CSS was embedded in HTML



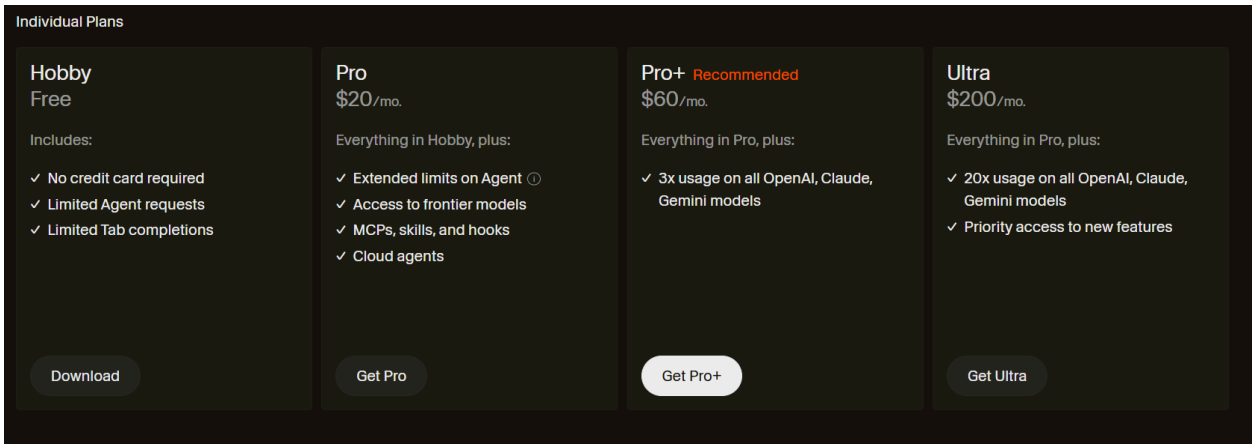
Prompt Used

What percentage of code did you fix/update by hand?

The adjustments I made by hand were pretty minor—just some padding, color picking, adding a gradient to the image, and fixing the image position. I already had about 90% of the results from the initial generation.

The only thing that took a bit more effort was finding the stock image from Unsplash.

In your opinion, was it worth using AI as a first step?



If I had done this from scratch without AI, it would've taken a couple of hours instead of about 15 minutes. So yeah, using AI was worth it for this task. That said, paying $20-50 for Cursor or any AI tool isn't really worth it for me right now, since I don't think I'd use it enough to get my money's worth or fully justify the cost, and if I tried it on a free version of ChatGPT, I would have had to wait till it would let me regenerate.
